

Aircraft Fleet View

Aircraft Fleet View is an App that gives you an always up-to-date view on your airline's fleet status.

Aircraft Fleet View indicates AOGs, delays and other important information. It provides the right level of detail to be useful but not crowded with information. The *CAMO Release to Service* is a feature that enables a guided workflow involving the commander and the CAMO for releasing the aircraft prior to each flight.

The Aircraft Fleet View app is meant for the management of an airline that wants to get a general overview over the status of their fleet. It can also be used by pilots as preparation for their next flight as well as by maintenance.

The app is easy to use and can be used in addition to other paperless tools like EFB and ETL.

By selecting the relevant menu, you get more details on:

- Aircraft Status: Every aircraft (or a defined range of fleet) is represented by a separate card. You see immediately which aircraft are ok, and which are facing a problem.
- W/O Status: Shows all your aircraft for which workorders are issued.
- Events: Shows all your A/C which have e.g. an AOG. You can also define other events to be shown in this overview.
- Messaging: Safe and secure communication between people or roles helps to streamline information
